

# **Learning Programming with MyCo / TPS**

Basically like playing Memory for Coders

## **Second Edition**

now with more Features included.

Chapters 0 to 8 are identical to the eBook version

**Free Simulator** for download

Online Simulator planned

**Prepared to download Code into ARDUINO**

**ARDUINO Source Code included**

**Alternative: Forth Code for TI MSP430G2553**

By Juergen Pintaske

**A combined Project  
and many People involved, mainly**

Burkhard Kainka

Wilfried Klaas

Michael Kalus

**The first Kit is based on Holtek Chip, now Simulator Options and Arduino-based**

**This Book is Copyright © ExMark, 15 November 2018**

**The current Forth Bookshelf can be found at**

<https://www.amazon.co.uk/Juergen-Pintaske/e/BooN8HVEZM>

**All are available as eBook – the ones with P after the number as well as print book.**

## A few first Words for this extended Version

**First:** There are some basic explanations in chapter 12, page 193 to get started.

Burkhard Kainka had a great idea: he defined a microcontroller kit, where a lot of the complexity has been taken out, and all you need is the controller in the middle,

4 Inputs 2 analog Inputs 4 LED outputs

1 additional Output to simulate an analog output voltage.

All you need to program and control this little PLC ( Programmable Logic Controller ) unit are 3 pushbuttons.

No PC required.

This first version is available from 3 sources as different setups:

from Franzis Verlag to learn programming and use the kit as a controller, but a lot has happened since it appeared.

There is as well a kit you can buy from Conrad – no soldering required, built via a solderless breadboard.

And the pre-programmed chip is available from AK-Modul.

Many people like this minimalistic approach, so many additional little applications are available via Burkhard's website.

An additional option was prepared by Wilfried Klass, where he made a Simulator available, where you can program and execute the same functionality – but no kit required.

But, seeing the real LED flash, or add the PLC to your model train or model board would be nice. Wilfried built this simulator for his own models – and for anybody who is interested.

The next step, leading to this second edition, was his work to couple the Simulator with external hardware and transfer the tested program. ARDUINO is the chosen hardware, as there are probably 1 million or more out there already many probably unused – so a nice target and no extra hardware required.

An additional option is then to take the chip out of the Arduino board, add what is needed in your application around and stick a new chip into the Arduino board.

I am a big fan of the computer language Forth. It is not so well known, but follows the minimalistic approach as well. There is a whole Forth Bookshelf for people who are interested.

And it is interactive, so you can modify the program on the fly. Michael Kalus was very kind and wrote an emulator of the TPS/MyCo functionality in Forth. It runs on a Texas Instruments MSP430G2553 chip and includes as well a serial interface function.

As result you can control the program on the chip either via the 3 buttons as before – or from your PC and kann display a lot of the internal status. See Chapter 10.

And as last point in Chapter 11: PROGRAMMING. How difficult is it really? Well, you do it every day without thinking about it.

I have chosen as first example a simplified making coffee using this controller and instructions. Just try to extend this using the other instructions, it should not be too difficult.

Oh, before I forget, in German the name is TPS; I could not find a good meaning for these 3 letters in English, so I just calld it MyCo – my controller, as it will be in your hand.

Enjoy reading.

November 2018 version 21

## 9.1 The Simulator and the Row of Buttons

|-- EXIT the program  
 | |-- CREATE a NEW program ( Control+N )  
 | | |-- OPEN a file ( Control+O )  
 | | | |-- SAVE the actual program ( Control + S )  
 | | | | |-- ADD a new line to the program  
 | | | | | |-- DELETE the actual line  
 | | | | | | |-- SHOW the actual programming file  
 | | | | | | | |-- UPLOAD the program to the target ( Control+U )  
 | | | | | | | | |-- CREATE a HEX file  
 | | | | | | | | | |-- EXECUTE a single instruction ( F5 )  
 | | | | | | | | | | |-- Execute the next step ( F8 )  
 | | | | | | | | | | | |-- STOP the debug program execution ( F6 )  
 | | | | | | | | | | | | |-- START / STOP program execution ( F9 )  
 | | | | | | | | | | | | | |--SELECT target Holtek-Mega8-TINY84-Arduino

**Memory:** Showing the memory locations where the instructions are stored

**Instruction:** Instruction to be executed at the memory execution

**Data:** Data related to the instruction

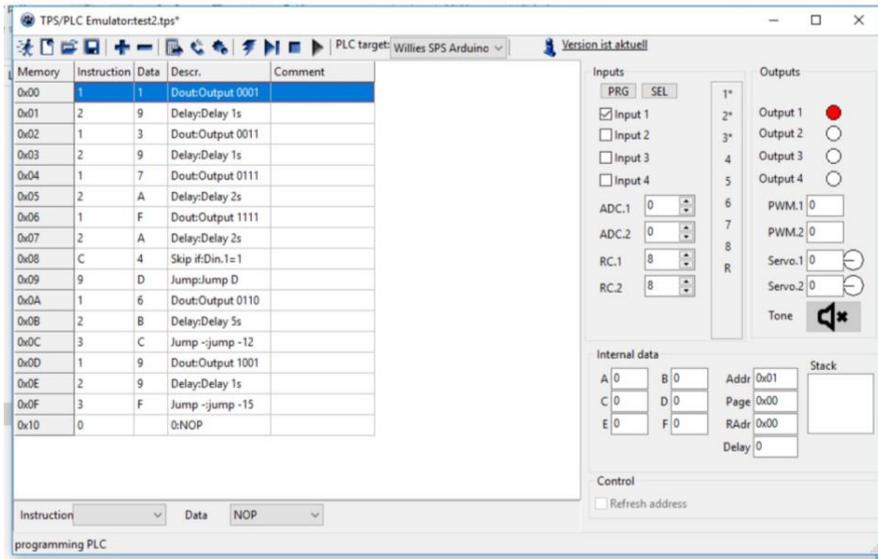

**Description:** Automatically added description

**Comment:** Own comment to be added

**Instruction:** Instruction to be inserted into the current memory location

**Data:** Then open Data and select related number or function

## 9.2 – The Function Window – on the right hand side

**PRG / Program SEL / Select**

### INPUTS:

- Input 1 – 4** The four inputs to be set by mouse click  
**ADC 1, 2** Two simulated analog inputs – input a number between 0 ... 255  
**RC1, 2** Two simulated RC outputs – input a number between 0 ... 255

### OUTPUTS:

- Output 1 – 4** The four output bits sent by the PLC – Programmable Logic Controller  
**PWM 1, 2** Pulse Width Modulated outputs, an ON / OFF rectangular output signal  
**Servo 1, 2** RC servo outputs, simulating the angle by showing a number plus icon  
**Tone:** A sound to be output – to be added later

### INTERNAL DATA of this PLC:

The inputs are fed via the instructions into registers **RA, RB, RC, RD, (RE, RF)** and processed

- Addr** The current memory location addressed  
**Page** Each memory block page consists of 16 locations, the page display changes accordingly  
 And JUMPs will setting up a PAGE number if different  
**Radr** **RETURN ADDRESS** – if subroutine is called, return address is shown here  
**DELAY** Showing time is a delay instruction is executed  
**( SKIP** If a skip decision is executed, 1 indicates jump over next instruction ) **tbd**

## 9.3 - Instruction Table

**Instruction Set** shaded in yellow aextensions of ArduinoSPS/ATTiny84 version.

	0	1	2	3	4	5	6	7

## 9.4 – TPS / SPS Emulator

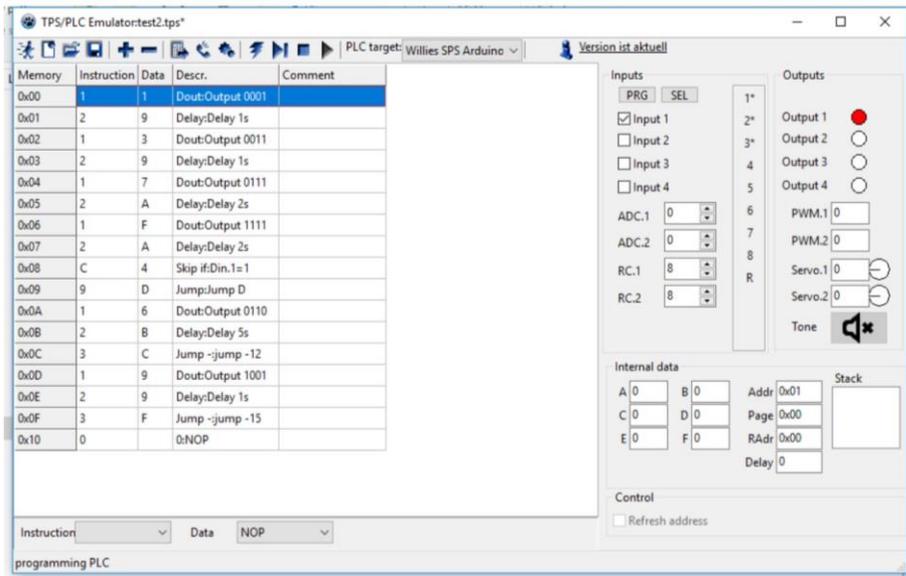

<http://wkla.no-ip.biz/ArduinoWiki/doku.php?id=arduino:arduinosps:spsemu>

Switch top left to English if needed. Copied from Willie's website

For the TPS PLC (and my extensions) I once wrote an emulator as a fun project.

Here the result.

The complete project is programmed in Lazarus (Freepascal).

The emulator can work with the different instruction sets of different TPS versions.

On the left you can see the programming window.

This can either be typed in directly or generated via the two combo boxes below.

There you can select the possible commands – dependent on the target selected of the included versions.

The commands can then be executed via the 4 buttons in the top center block.

**The first button** tests the currently selected command (jumps are not carried out)

**The second button** executes the program in single-step mode.

**The third button** stops single-step mode

**The fourth button** is Start-Stop, to run at maximum speed.

In the left window you make the entries and view the results as you step through the program.

At the bottom you can see a few more the drop downs with the instructions.

.

On the right you can set inputs and see results at the outputs.

The lower block on the right shows what is happening internally in the simulated processor.

And additional documentation in English will be made available.

**ATTENTION:** The current version of Avira Antivirus has a false positive message.

## 9.6 – Instruction Set

Areas shaded in yellow are extensions of my ArduinoSPS and ATTiny84 version.

	0	1	2	3	4	5	6	7
	n.n.	Port	Delay	Jump back relative	A=	„=A“	A=	A= Options
0	NOP	off	1ms	0	0	A<->B		
1		1	2ms	1	1	B=A	A=B	A=A + 1
2		2	5ms	2	2	C=A	A=C	A=A - 1
3		3	10ms	3	3	D=A	A=D	A=A + B
4		4	20ms	4	4	Dout=A	Din	A=A - B
5		5	50ms	5	5	Dout.0=A.0	Din.0	A=A * B
6		6	100ms	6	6	Dout.1=A.0	Din.1	A=A / B
7		7	200ms	7	7	Dout.2=A.0	Din.2	A=A and B
8		8	500ms	8	8	Dout.3=A.0	Din.3	A=A or B
9		9	1s	9	9	PWM.0=A	ADC.0	A=A xor B
a		10	2s	10	10	PWM.1=A	ADC.1	A= not A
b		11	5s	11	11	Servo.0=A	RCin.0	A= A % B (Rem.)
c		12	10s	12	12	Servo.1=A	RCin.1	A= A + 16 * B
d		13	20s	13	13	E=A	A=E	A= B - A
e		14	30s	14	14	F=A	A=F	
f		15	60s	15	15	Push A	Pop A	

### Additional Features of the ArduinoSPS version:

- ☒ There are 2 additional registers (E and F)
- ☒ And there is a stack area with the 2 usual interface methods push ( add to stack) and pop (take off the stack). There are 16 level positions in this stack.
- ☒ There are also 2 new calculations; one is the remainder of a division ( $A = A \% B$ ) and one an 8-bit conversion.  $A = A + 16 * B$
- ☒ Since version 0.6, the swap command has also been added, swapping the A and B register contents.
- ☒ And a new calculation  $A = B - A$ . Especially, when you are working in an 8-bit space, it is sometimes quite cumbersome to carry out such an operation without.

8	9	a	b	c	d	e	f

14	14	14	14	S_PRG=1	14		
15	15	15	15	S_SEL=1	15	restart	PrgEnd

#### Additional Features in this ArduinoSPS version:

- ☒ As we now have more EEPROM memory, the page area is been extended to 16 pages. So, you can now enter a program that is 256 bytes long.
- ☒ Regarding the Skip command, there is now as well the Skip command for condition A = 0.
- ☒ Via the E commands, you can now program 6 real subroutines. These are created using the Def# command. With Call# the routine is started. With Return you come back to the main program. The Def# may also be positioned above the 256 bytes in the EEPROM. So, also outside the range of the jump commands.
- ☒ Also new is the Restart command, which restarts the entire controller.
- ☒ In the F area, there are the new commands located, which work with the extended 8-bit resolution.
- ☒ FF means end of program. → and an automatic jump to program location 00.

And now please have fun with the ArduinoSPS.

Oh, and as always: everything without any warranty ...

And here the picture of a small test setup:

## 10 – TPS / MyCo written in Forth

As you might have seen in one of the first pages, most of the books I publish are related to the language FORTH.

When the first version was written, I just got into Forth again after a long time.

I got great help from Michael Kalus, who could be convinced to emulate Burkhard Kainka's TPS in Forth, written for the TI MSP430 in a 20-pin package.

This then led to the MicroBox, a small board plus the option of a header board – which as you can see now, exactly has the 3 switches and 4 LEDs plus one for PWM output.

All of the TPS functions can be replicated, but here you actually have a complete FORTH Interpreter/Compiler ON the chip as well. There is a command to exit the "local" function control of the 3 switches to the serial terminal function.

The extension of this book adds the opportunity to include the Forth code now, so people can give it a go and understand Forth code.

A good starting point would be to look at the documetation at

<http://wiki.forth-ev.de/doku.php/en:projects:a-start-with-forth:start>

For the eBook / Print Book, see the Forth Bookshelf at

<https://www.amazon.co.uk/luergen-Pintaske/e/BooN8HVEZM>

Here the code that had been running on these boards.

To Flash the initial program into the chip needs the TI Launchpad connected to the PC. Afterwards the chip is independent just needing a USBtoSERIAL – or if just used as controller with the TPS Interface and nothing else is needed.

See pictures on page 118.

```
\ MyCo \ using 4e4th Release0.34b
\ Version 0.91 - edit pages using only S2 and S1.
\ started: 2014_08_10 now 2015_03_28

\ Achtung:
\ Zweistellige Ziffern sind Kommandos in MYCO !!
\ Willst du Zahlen eingeben, müssen Nullen davor sein.
\ Beispiel:
\ 59 lädt Register A in das PWM-Register.
```

```

\ 0059 legt den Zahlenwert 59 auf den Datenstack.

\ Careful:
\ Two-digit numbers are commands in MYCO !!
\ If you want to enter numbers, zeros must be in front of them.
\ Example:
\ 59 loads register A into the PWM register.
\ 0059 places the number 59 on the data stack.

\ Issues:
\ WIPE strikes after EDIT ;          fixed 24.02.2015
\ ugly EDIT; made a better one;     12.10.2014
\ S1 and S2 input faild sometimes; fixed 12.10.2014
\ STEP does wrong dumping;          fixed 08.10.2014

\ ++++++
\
\ Start of the Program MyCo, programmed in Forth
\ Based on Burkard Kainka's TPS, Juergen Pintaske
\ translated the German Manual into English and extended it.

\ This program in Forth simulates a very small processor, running
\ in a Franzis Kit which is planned to help Learning Programming;
\ and we use it here as an example of how to program the TI
\ MSP430 Controller. Owners of this Franzis kit can just add a
\ programmed MSP430G2553 and a reset resistor and replace the Holtek.
\ And all three options can be used to learn:
\   First, use the original TPS, running on a Holtek Processor,
\       and with the Hardware available from Franzis or Conrad.
\   Second, use the existing Hardware, take the Holtek chip out
\       and add a little board with the MSP430 Controller on it.
\       Just jumper the necessary wires to the preprogrammed MSP430.
\   Third, get a programmed MSP430 controller, add the 5 resistor LED
\       combinations and the 3 switches to 430 board,
\       and run completely in the MSP430,
\       but in addition
\       now with aserial
\       terminal control, showing on screen what actually happens
\       internally in all of the simulated processor registers.
\ This all looks like an overkill, but the target is here:
\ Learn Programming in a language called Forth
\ - so as an Application.

```

```

\ A Note when using the serial terminal function:
\ Use the hex numbers only with preceding zeros.
\ Any hex XX without a proceeding 0 is interpreted as a command.
\ Example:
\ 71 is the command A<=A+1, 0071 is interpreted as a number.

\ Defining the I/O for this application

\ Device Pinout: MSP430G2553 20-Pin PDIP
\

\ -----IN2 P2.2--[10 11]--P2.3 IN3
\ LP = TI Launchpad
\
\ P1.0 used as Input, later on as Analog Input 1
\ P1.1 RX and
\ P1.2 TX are used as the serial interface to the PC,
\ mostly via USBtoTTL
\ P1.3 used as S2, as on the TI Launchpad,
\ the internal resistor is enabled
\ P1.4 used as Input, later on as Analog Input 2
\ P1.5 used as Output, later on to output a frequency
\ with defined length
\ P1.6 Output, later on as Pulse Width Modulation output
\ - quasi D/A Output
\ resistor about 470 Ohms and LED to Ground
\ P1.7 Input S1, internal resistor enabled

\ P2.0 Input 0 internal resistor enabled, so open input means HIGH
\ P2.1 Input 1 internal resistor enabled, so open input means HIGH
\ P2.2 Input 2 internal resistor enabled, so open input means HIGH
\ P2.3 Input 3 internal resistor enabled, so open input means HIGH

\ P2.4 Output 0 resistor about 470 Ohms and LED to Ground

```

```

\ P2.5 Output 1 resistor about 470 Ohms and LED to Ground
\ P2.6 Output 2 resistor about 470 Ohms and LED to Ground
\ P2.7 Output 3 resistor about 470 Ohms and LED to Ground

\ One of the important issues to be solved here
\ was to use the FLASH memory of the MSP430 as an
\ EEPROM functionality needed for local programming,
\ this is an internal issue for later and can be skipped for now
\ The original Holtek Controller has 128 Bytes of EEPROM

\ 'EEROM' simulaton in flash memory -- see the chapter further down

\ The Programming Model of this Minimum Processor
\ is simulated in Forth.
\ Remember: for simplicity this processor is used
\ as 4 bit, everything is in nibbles.
\ This is about the same processor
\ as in Burkhard Kainka's original design:

\ PC Program Counter limited to address memory locations 0 - 127,
\ 00 to 7F in HEX
\ PG Page register 4 bit, combined with the 4 bit jump address
\ achieves the 256 ($100)
\ DL Delay register, a delay from lms to 60 sec can be programmed.
\ SK Skip register indicates a possible skip over instructions
\ based on comparisons
\ There are no conditional branches
\ - just these Conditional Skips for simplicity
\ Easy for beginners as the program code is relocatable
\ (address independent)

\ The main processor registers and other registers:

\ IN 4 bit input, when used reflects the status of the 4 Input lines
\ A 4 bit A register, somehow the central register,
\ the ALU works with A register
\ B 4 bit B register
\ C 4 bit C register
\ D 4 bit D register
\ A1 4 bit Analog Input Channel 1
\ A2 4 bit Analog Input Channel 2
\ PW 4 bit Pulse Width Modulated Output, can used filtered
\ as quasi analog output

```

```

\ OU 4 bit output register, 4 Output Pins will reflect
\                                     the contents, LEEDS display it

\ There are two options to program the program
\   for this simulated processor:
\   via the switches (and needs setting the IN bits
\   for page selection), or
\   control completely via the serial interface
\   - mostly to a PC, after enter q
\   so a more complex part of this program is used to
\   show the processor status
\   on the monitor
\   Display all of the variables in this processor,
\   here formatted differently

\ PC  PG DL SK   IN  A  B  C  D  A1 A2 PW  OU
\ x x x x x     x  x  x  x  x  x  x  x  x

\ The next part of thei program is related to showing
\   how the FLASH Memory is used
\   as simulated EEPROM, so skip over this for now.

\ *** Let us start with an empty user flash ***

HEX  \ Just set for terminal IO and display,
      \   the options are HEX  and DECIMAL

\ membot 0000 + constant seg0 ; this did not work, see issues.
\ membot 0200 + constant seg1

\ PAD constant CACHE \ PAD is already there in forth,
\   so we use it. Commented out here

1000 constant EE0  \ start address of info-d
1040 constant EE1  \ start address of info-c
0040 constant SEGSIZ \ segment size
0010 constant BLKSIZ \ bytes in block (alias "page" of MyCo)

variable SEG  \ holding segment number in use
variable BLK  \ holding block number
variable UPD  \ this variable shows if the cache has been updated

```

```
\ As we are simulating an existing system,  
\ we use the same TPS example programs  
\ 128 bytes of example programmes = 8 pages -- page0 .. page7
```

```

```

```

\ Now the real activity starts: The default programs above
\ are copied into the
\ 128 bytes of Program Area available for programming
\ and will show some demos,
\ using this code \ after a Reset.

```

HEX

```

: PRG0 \ -- \ copy the default progams to the
          \ simulated 'eeprom' area in FLASH
ee0 segsiz flerase
ee1 segsiz flerase
ex0 ee0 extend ex0 - d->i ;

```

```

\ The memory of the MSP430 will be rather fully used.
\ So, to save Program Space,
\ the 4 Bit Nibbles are packaged into 4 nibbles
\ to be one Variable of 16 bits.
\ This will save on RAM used, and is as well a programming exercise.

```

```

\ Juggling nibbles      mk0 (this shows how extensively
                          the code has been tested)

```

HEX

```

: 0! \ n adr -- \ store nibble 0 to value at address
>r r@ @ FFF0 and swap F and + r> ! ;

: 1! \ n adr -- \ store nibble 1 to value at address
>r r@ @ FF0F and swap F and 4 lshift + r> ! ;

: 2! \ n adr -- \ store nibble 2 to value at address
>r r@ @ F0FF and swap F and 8 lshift + r> ! ;

: 3! \ n adr -- \ store nibble 3 to value at address
>r r@ @ 0FFF and swap F and C lshift + r> ! ;

```

```

: 0@ \ adr - n \ fetch nibble 0 of value at address
@ 000F and ;

: 1@ \ adr - n \ fetch nibble 1 of value at address
@ 00F0 and 0004 rshift ;

: 2@ \ adr - n \ fetch nibble 2 of value at address
@ 0F00 and 0008 rshift ;

: 3@ \ adr - n \ fetch nibble 3 of value at address
@ F000 and 000C rshift ;

```

```

\ As a first step, we have to define and program the relevant IO Bits
\ of the chip as Input (with enabling internal pull-up resistor)
\ or as Output.
\ In this part of the program you can find the relevant memory mapped
\ addresses to
\ Set the IO functionality,
\ Read Input Data,
\ Write Output Data
\ Some of the possible internal MSP430 functions are rather complex,
\ so here
\ IO Bits are used as simple Input / Output only,
\ additional Forth Code later

```

#### HEX

```

```

```

\ --> intermediate-stage-2.txt

```

```

\ -----
\ Simulate 'EEPROM' using INFO-C and -D flash memory.

```

```

\ Note:
\ The idea is to have a cache, edit there, and flush it back
\ to mass storage when done.

```

```

\ Have a cache in 4e4th - where is RAM for it?
\ An info segment is 64 bytes.
\ Address range is $1000 .. $107F
\ That is 128 bytes or 8 blocks of 16 bytes each.
\ Forth scratch PAD is 80 bytes.
\ PAD is not used inside of Forth.
\ So a segment buffer, the cache, may be build in PAD area.

```

```
\ Only whole segments of flash can be written.
\ So get segment into cache, edit block there,
\ and flush back when done or a block in the other segment is used.
```

```
\ Naming memory segments, cache, its variables and constants:
```

```
HEX
```

```
: wipecache \ -- \ fill cache with zeros, set variables...
  pad segsiz 0 fill
  0 upd ! FFFF blk ! 0 seg ! ;

: update \ -- \ mark the cache as updated
  FFFF upd ! ;
```

```
\ Examine 'eeprom' and cache
```

```

## MyCo Control Instructions

Michael Kalus/ Juergen Pintaske

Version 0.9.1 4e4th Version 2015\_04\_04

### Switching on Power or Reset starts MyCo program.

The 4 LEDs at OUT will flash. The indicator LED (PWM LED) is switched off.

**Idle State** - MyCo is ready and waiting for an input either via S1 / S2 or via the keyboard.

**S1 - Switch pressed** - MyCo program starts

**S2 - Switch pressed** - MyCo switches into Programming Mode  
– no connection to the PC required

**'q' - Entered on Terminal** - 4e4th Forth starts (Only works if keyboard is connected / MyCo in Idle State)

### - To Run a Program already installed-

In Idle State press S1. MyCo will then enter the Program Run Mode. MyCo programs always start at page 0 address \$00. To terminate a running MyCo program: press S1 or S2 key - or any key on the keyboard.

### - Show the Program Flow –

#### A)-using the 4 LEDs ---

To view the program steps from the outside, a MyCo program has to make outputs to the 4 LEDs, otherwise nothing is visible. Additional LED test output instructions can be added for debugging. Later replaced by NOPs. Extensions: Use a volt meter to check the levels at IN and OUT and to watch – or a multimeter or an oscilloscope.

#### B) Using Forth and the Serial Interface--- Using the additional options

The MyCo Program runs using the Interactive Programming Language Forth. There are 3 additional services provided in this mode in order to test the program flow step by step. Using the space bar on the keyboard, you step through the whole program. The status of all registers and other IO are shown:

**LOG** writes the MyCo program sequence step by step. Press the space bar to step through the whole program.

Register contents, state at Input Port and Output Port will be displayed.

**STEP** displays the entire contents of the MyCo memory in one go. Here as well, step through the whole program by pressing the space bar. Registers and Ports are displayed step by step.

So you see exactly at which point of the program you are and which activity has been executed (single stepping).

**RUN** starts the MyCo Program in Flash memory. In this way the effects on periphery can be seen. Pressing any key on the keyboard stops the MyCo program execution, and you come back to the Forth Operating System level.

## **- Programming –**

Press S2 when in Idle State. MyCo status changes into the Programming Mode. Programming of a MyCo program is done code block by block (page), then each block byte by byte, and each byte nibble by nibble. To start, first the target page must be selected that will be processed.

### **- Select Page -**

Indicator LED flashes 3 times. Using S1, one of 8 pages can be selected. Default page is page-0. Continue using S2.

### **- Select Bytes -**

By repeatedly pressing S2 one program byte after the other can be displayed. In This way all bytes of the selected page can be inspected, contents will be shown via the 4 LEDs. Here each byte is shown in three steps.

## View Memory Contents - Press S2 repeatedly

Step	Indicator LED (PWM)	Description of 4 LED display
1	2x flashing in medium bright	byte address within the page
2	from off -> to bright	high nibble
3	from off-> to dim	low nibble

The **Read/Modify Modus** starts at byte address zero, so the 4 LEDs are thus first all switched off.

Press S2 and the Hi-nibble of the byte is displayed.

S2 again, and the Lo nibble is displayed.

Press again S2, and MyCo begins another 3-step display, now at byte address +1

After 16 bytes the procedure starts again at byte 0, MyCo stays on same page (wrap around).

- **Edit a Nibble** - In Step\_2 or Step\_3 the contents of a nibble can increment by pressing S1. After \$F the value is back to zero. You can step through the value as often as needed. End of nibble change input with S2.

- **Select Byte Start Address** – If in step\_1 button S2 is kept pressed, MyCo jumps into Start Address Select. Indicator LED flashes 1x, LEDs show the current byte address, incremented via S1. If new address set, S2 changes mode back to 3 step display from the new address.

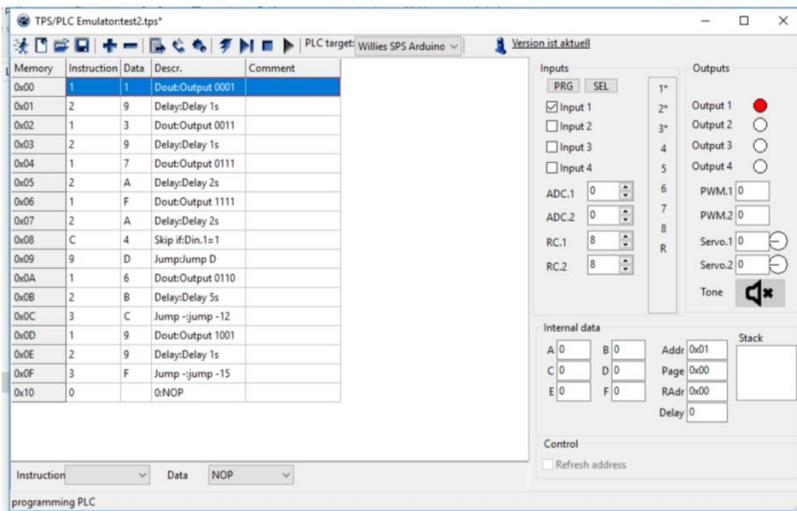

- **End Editing and Transfer and Program into FLASH Memory** - Press both buttons, S2 + S1 simultaneously;

Back to IDLE Mode, 4 LEDs flash, at the same time edited page is written back to Flash memory.

MyCo returns to IDLE MODE. In this case, changes to the nibbles are transferred to the 'eeprom'.

## 9.1 The Simulator and the Row of Buttons

|-- EXIT the program  
| |-- CREATE a NEW program ( Control+N )  
| | |-- OPEN a file ( Control+O )  
| | | |-- SAVE the actual program ( Control + S )  
| | | | |-- ADD a new line to the program  
| | | | | |-- DELETE the actual line  
| | | | | | |-- SHOW the actual programming file  
| | | | | | | |-- UPLOAD the program to the target ( Control+U )  
| | | | | | | | |-- CREATE a HEX file  
| | | | | | | | | |-- EXECUTE a single instruction ( F5 )  
| | | | | | | | | | |-- Execute the next step ( F8 )  
| | | | | | | | | | | |-- STOP the debug program execution ( F6 )  
| | | | | | | | | | | | |-- START / STOP program execution ( F9 )  
| | | | | | | | | | | | | |--SELECT target Holtek-Mega8-TINY84-Arduino

**Memory:** Showing the memory locations where the instructions are stored

**Instruction:** Instruction to be executed at the memory execution

**Data:** Data related to the instruction

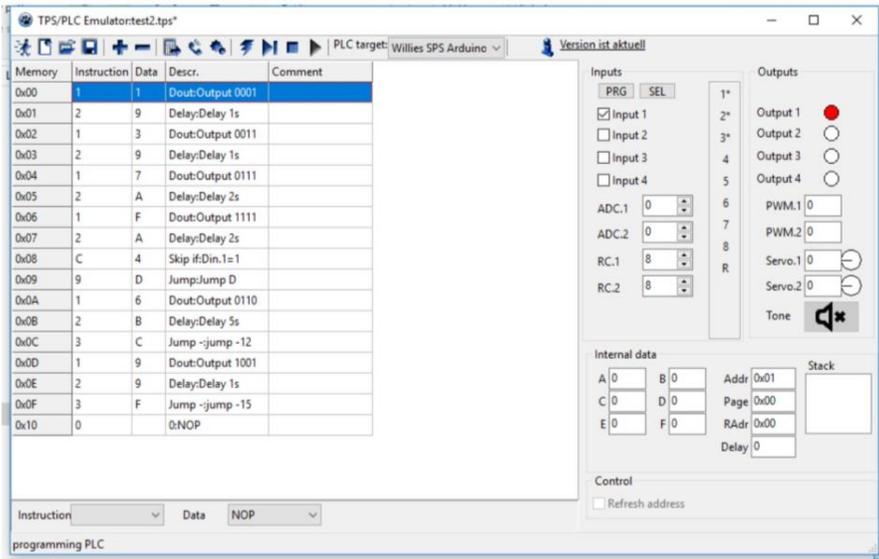

**Description:** Automatically added description

**Comment:** Own comment to be added

**Instruction:** Instruction to be inserted into the current memory location

**Data:** Then open Data and select related number or function

## 9.2 – The Function Window – on the right hand side

**PRG / Program SEL / Select**

### INPUTS:

**Input 1 – 4** The four inputs to be set by mouse click

**ADC 1, 2** Two simulated analog inputs – input a number between 0 ... 255

**RC1, 2** Two simulated RC outputs – input a number between 0 ... 255

### OUTPUTS:

**Output 1 – 4** The four output bits sent by the PLC – Programmable Logic Controller

**PWM 1, 2** Pulse Width Modulated outputs, an ON / OFF rectangular output signal

**Servo 1, 2** RC servo outputs, simulating the angle by showing a number plus icon

**Tone:** A sound to be output – to be added later

### INTERNAL DATA of this PLC:

The inputs are fed via the instructions into registers

**RA, RB, RC, RD, ( RE, RF )** and processed

**Addr** The current memory location addressed

**Page** Each memory block page consists of 16 locations,  
the page display changes accordingly

And JUMPs will setting up a PAGE number if different

**Radr** **RETURN ADDRESS** – if subroutine is called, return address is shown here

**DELAY** Showing time is a delay instruction is executed

**( SKIP** If a skip decision is executed, 1 indicates jump over next instruction ) **tbd**

## 9.3 - Instruction Table

**Instruction Set** shaded in yellow aextensions of ArduinoSPS/ATTiny84 version.

	0	1	2	3	4	5	6	7
	n.n.	Port	Delay	Jump back rel	A= „=A“		A=	A= Options
0	NOP	off	1ms	0	0	A<->B		
1		1	2ms	1	1	B=A	A=B	A=A + 1
2		2	5ms	2	2	C=A	A=C	A=A - 1

## 9.4 – TPS / SPS Emulator

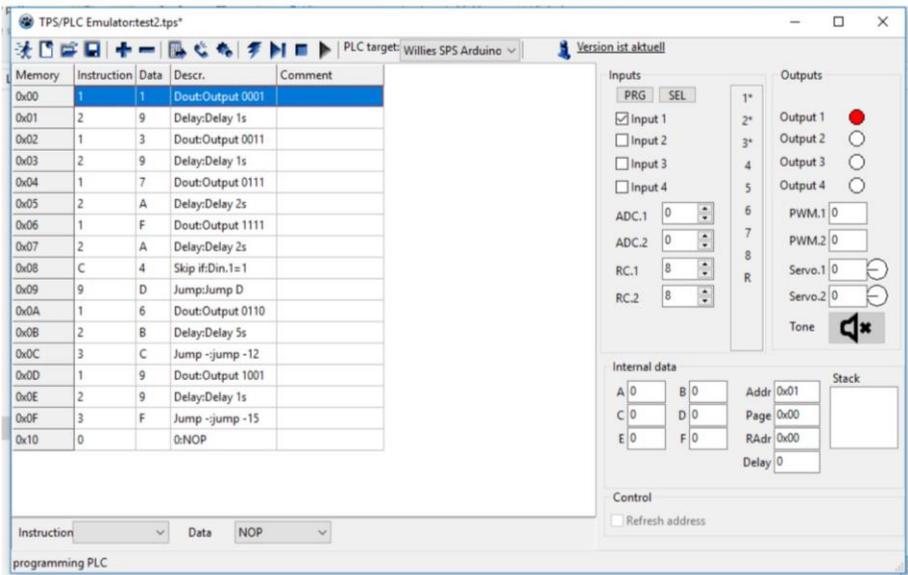

<http://wkla.no-ip.biz/ArduinoWiki/doku.php?id=arduino:arduinosps:spsemu>

Switch top left to English if needed. Copied from Willie's website

For the TPS PLC (and my extensions) I once wrote an emulator as a fun project.

Here the result.

The complete project is programmed in Lazarus (Freepascal).

The emulator can work with the different instruction sets of different TPS versions.

On the left you can see the programming window.

This can either be typed in directly or generated via the two combo boxes below.

There you can select the possible commands – dependent on the target selected of the included versions.

The commands can then be executed via the 4 buttons in the top center block.

**The first button** tests the currently selected command (jumps are not carried out)

**The second button** executes the program in single-step mode.

**The third button** stops single-step mode

**The fourth button** is Start-Stop, to run at maximum speed.

In the left window you make the entries and view the results as you step through the program.
